MIN. YEARS OF RADIOACTIVE WASTE STORAGE

THE COMPANY

COVRA is the Central Organization for Radioactive Waste in the Netherlands. Under the Dutch Nuclear Energy Act, any company in the Netherlands licensed to work with radioactive materials is bound by law to tender its waste to COVRA. The radioactive waste is collected, stored aboveground, and provided continuous care by COVRA for a period of at least 100 years while research is conducted on possibilities for safe and stable disposal.

THE CHALLENGE

The Dutch Nuclear Energy Act requires COVRA to safely and efficiently manage operational assets and related engineering data. COVRA was using an in-house developed TABS application to manage as-built asset information. After 10 years, the TABS application had to be replaced with standard solutions for maintenance management and engineering information management to perform tasks such as document management, asset management, and management of working permits.

THE SOLUTION

COVRA selected [Meridian](#) to manage engineering information related to assets and cables, and Ultimo Maintenance Management to manage maintenance orders and work permits. The integration between these systems provides Ultimo Maintenance Management users with one-click access to technical documentation stored in Meridian.

- Version and change management for engineering drawings
- Document and asset classification according to the Kraftwerk-Kennzeichensystem (KKS) identification system
- Standard integration with Ultimo Maintenance Management

THE RESULTS

Central storage offers a clear overview of who is working on which version of a document, prevents several versions being in circulation at the same time, and avoids changes being made in different versions. Meridian also supplies extensive search options to quickly and easily find engineering documents

Asset-related engineering information is carefully controlled by COVRA and monitored by government inspectors and international organizations, resulting in improved efficiency and compliance.

- Compliance with Dutch
- Nuclear Energy Act
- Improved efficiency through faster document search and retrieval
- Streamlined engineering and project activities
- Increased quality of asset and engineering information
- Direct access to up-to-date engineering information for Maintenance
